- Investigate how autonomous vehicles can be used on streets, especially considering interactions with pedestrians, other vehicles, and various age groups, including children.
- Explore the potential for collaboration between researchers working on similar projects to enhance research outcomes.
- Consider using machine learning models like CNN or R-CNN to capture depth and facilitate research on autonomous vehicles and their security.
- Investigate and address security concerns related to autonomous vehicles to prevent identity theft and unauthorized control.
- Develop a virtual reality simulation for pedestrians to build trust and test comfortability with autonomous vehicles

00:58 : Johnson

Yeah, that is interesting because you know a few months ago, A1 asked me to participate in her research.

01:08 : Johnson

She also was doing some research in the similar area.

01:14 : Johnson

Maybe she can help, what do you think?

01:17 : Maria

I think there is a lot of scope of improvement. 😊

01:21 : Maria

Would you consider Tesla as an example of autonomous vehicles

- The primary focus of the meeting was on a project concerning autonomous and connected vehicles. The project aims to explore how these vehicles can be integrated into urban environments, considering interactions with pedestrians and other vehicles.
- Research Collaboration:
 - It was mentioned that a colleague, A1, is conducting similar research, and collaboration could be beneficial. There is potential for improving current models and systems related to autonomous vehicles.
- Technological Examples:
 - Tesla was cited as an example of a company leading in the autonomous vehicle space, although it was noted that their vehicles are not fully autonomous as human intervention is still
